Isolation and tiling
Together in a single material... **Isotile**. By VitrA.

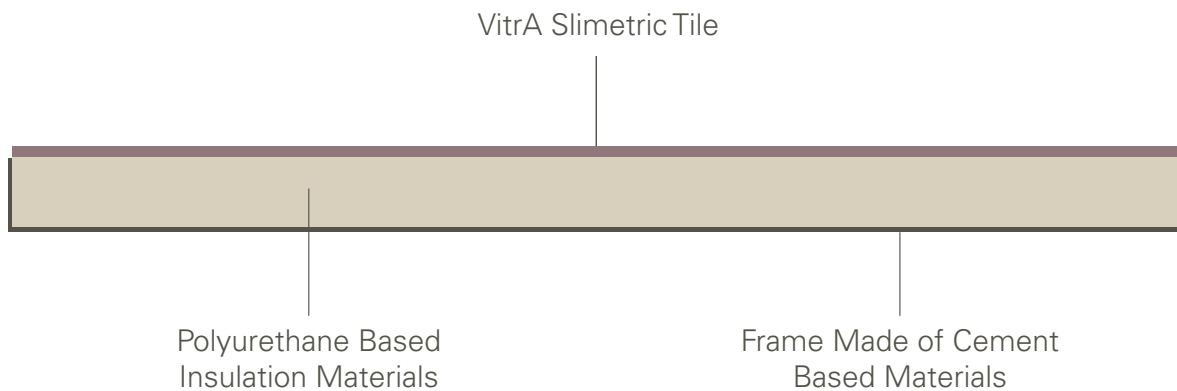

Isotile

You want a long-lasting isolation done on the exterior of your building. And it would be great to have it topped off with a decorative and durable tile cladding... How about taking care of both jobs at one go, with a single material, and treating your project to Vitra's quality and reliability?

Meet Isotile. An innovative tile product that allows you to heat insulation and clad exteriors at a single step. Slim and strong, Isotile significantly reduces the weight of the cladding while providing excellent insulation and durability. Insulating against heat and sound.

Isotile takes care of them all, and it is available in different sizes and colour to offer you a perfect match for all kinds of exteriors. Isotile has arrived to change how you go about heat insulation and cladding.

What is the advantage of Isotile compared to the similar products on heat insulation grounds?

Due to low conductive heat transfer coefficient of the insulation material used, Isotile generated the same heat insulation with less thickness. Besides, Isotile doesn't lose its heat insulation characteristics in time.

How is it possible to mount Isotile so easily?

Isotile is mounted without profile via sealing and plastic wall plug, mechanical mounting. Mounting is quite easier compared to jacketing method besides the cladding facade with profile. While separate mounting and furnishing are carried out for different component in both methods, Isotile is mounted on its own at once.

What are the advantages of Isotile in furnishing?

Insulation generated with an insulation material of 50 mm thickness is managed with a thickness of 43 mm, including covering material. It's furnished 50% faster than jacketing. The burden imposed on the facade is lessened with the Slimetric tiles of 5 mm thickness.
